

Here's What's New in South Dakota Truck Trends

Data from the Census Bureau's 1997 Vehicle Inventory and Use Survey are now available for South Dakota. This survey produces state and U.S. level statistics on the physical and operational characteristics of the Nation's truck, van, minivan, and sport utility vehicle population.

There were an estimated 361,500 private and commercial trucks registered in South Dakota during 1997, up more than 22 percent from the approximately 295,000 trucks registered in 1992.

The survey includes these highlights for South Dakota:

The number of minivans registered in South Dakota during 1997 increased 172.5 percent from 1992. In comparison, the number of sport utility vehicles (SUVs) increased 53.8 percent and the number of pickups increased 13.6 percent during this same period.

- Total truck registrations in 1997 included 56.1 percent pickups, 14.2 percent SUVs, and 10.7 percent minivans.
- South Dakota has approximately one pickup for every 4 people and about one SUV for every 14 people. It also has approximately one pickup for every 3 licensed drivers and about one SUV for every 10 licensed drivers.

- Approximately 5.8 percent of all large trucks carried hazardous materials in 1997.
- About 53.4 percent of all trucks were used for personal transportation, while 43.9 percent were operated for business, including for-hire use.

The report also includes information on fuel efficiency, annual and lifetime mileage, model year, equipment accessories and other data for each kind of registered truck.

The U.S. Summary will be issued in late 1999, following the release of reports for the 50 states and the District of Columbia. This survey is conducted every five years as part of the Economic Census and data are used by government agencies, business, industry, academia, and the general public.

The estimates from the 1997 Vehicle Inventory and Use Survey are subject to sampling and nonsampling error. Sources of nonsampling error include errors of response, non-reporting and coverage. Measures of sampling variability, presented as relative standard errors, are shown in the tables in the report.
